Gene Summary:Component of the EKC/KEOPS complex that is required for the formation of a<br/>threonylcarbamoyl group on adenosine at position 37 (t(6)A37) in tRNAs that read codons<br/>beginning with adenine. The complex is probably involved in the transfer of the<br/>threonylcarbamoyl moiety of threonylcarbamoyl-AMP (TC-AMP) to the N6 group of A37.<br/>GON7 likely plays a supporting role to the catalytic subunit OSGEP in the complex.<br/>[UniProtKB/Swiss-Prot Function]
