q
RF insert of this clone is exactly the same as(MR213850).
nolecular sequence of this clone aligns with the gene accession number as a point of ence only. However, individual transcript sequences of the same gene can differ through rally occurring variations (e.g. polymorphisms), each with its own valid existence. This is substantially in agreement with the reference, but a complete review of all prevailing ints is recommended prior to use. <u>More info</u>
lone was engineered to express the complete ORF with an expression tag. Expression s depending on the nature of the gene.

Gene Summary:Olfactory receptors interact with odorant molecules in the nose, to initiate a neuronal
response that triggers the perception of a smell. The olfactory receptor proteins are
members of a large family of G-protein-coupled receptors (GPCR) arising from single coding-
exon genes. Olfactory receptors share a 7-transmembrane domain structure with many
neurotransmitter and hormone receptors and are responsible for the recognition and G
protein-mediated transduction of odorant signals. The olfactory receptor gene family is the
largest in the genome. The nomenclature assigned to the olfactory receptor genes and
proteins for this organism is independent of other organisms. [provided by RefSeq, Jul 2008]
