However, individual transcript sequences of the same gene can differ through naturally occurring variations (e.g. polymorphisms), each with its own valid existence. This clone is substantially in agreement with the reference, but a complete review of all prevailing variants is recommended prior to use. <u>More info</u>
OTI Annotation:	This clone was engineered to express the complete ORF with an expression tag. Expression varies depending on the nature of the gene.

Gene Summary:This gene encodes a small secreted protein that is expressed in the epididymis and binds<br/>retinoic acid. The precursor protein is processed into both a longer major form and a shorter<br/>minor form. Alternatively spliced transcript variants encoding multiple isoforms have been<br/>observed for this gene. [provided by RefSeq, Jan 2013]
