	Ngef (NM_019867) Mouse Tagged ORF Clone Lentiviral Particle – MR219446L4V
Gene Summary:	Acts as a guanine nucleotide exchange factor (GEF) which differentially activates the GTPases RHOA, RAC1 and CDC42. Plays a role in axon guidance regulating ephrin-induced growth cone
	collapse and dendritic spine morphogenesis. Upon activation by ephrin through EPHA4, the

GEF activity switches toward RHOA resulting in its activation. Activated RHOA promotes cone

retraction at the expense of RAC1- and CDC42-stimulated growth cone extension. [UniProtKB/Swiss-Prot Function]
