Product datasheet for MR219966L3V

Ucma (NM_001165932) Mouse Tagged ORF Clone Lentiviral Particle

Product data:

Product Type:	Lentiviral Particles
Product Name:	Ucma (NM_001165932) Mouse Tagged ORF Clone Lentiviral Particle
Symbol:	Ucma
Synonyms:	1110017I16Rik; AW121955; Grp
Mammalian Cell Selection:	Puromycin
Vector:	pLenti-C-Myc-DDK-P2A-Puro (PS100092)
Tag:	Myc-DDK
ACCN:	NM_001165932
ORF Size:	315 bp
ORF Nucleotide Sequence:	The ORF insert of this clone is exactly the same as(MR219966).
OTI Disclaimer:	The molecular sequence of this clone aligns with the gene accession number as a point of reference only. However, individual transcript sequences of the same gene can differ through naturally occurring variations (e.g. polymorphisms), each with its own valid existence. This clone is substantially in agreement with the reference, but a complete review of all prevailing variants is recommended prior to use. <u>More info</u>
OTI Annotation:	This clone was engineered to express the complete ORF with an expression tag. Expression varies depending on the nature of the gene.
RefSeq:	<u>NM 001165932.1, NP 001159404.1</u>
RefSeq Size:	785 bp
RefSeq ORF:	318 bp
Locus ID:	68527
UniProt ID:	<u>Q14BU0</u>
Cytogenetics:	2 A1

Gene Summary:This gene encodes chondrocyte-specific, highly charged proteins that are abundantly
expressed during the early stages of chondrogenesis. The encoded protein undergoes
proteolytic processing to generate a mature protein that is secreted into the extracellular
matrix. The glutamic acid residues in the encoded protein undergo gamma carboxylation in a
vitamin K-dependent manner. Despite the implied role in calcification and ossification, mice
lacking the encoded protein do not display significant defects in the skeletal development.
Alternative splicing results in multiple transcript variants encoding different isoforms that
may undergo a similar proteolytic processing to generate mature proteins. [provided by
RefSeq, Aug 2015]
