Gene Summary: May be required during spermatogenesis, probably by participating in the repression of retrotransposable elements and prevent their mobilization (Probable). With its paralog, Tex19.1, collaborates with the Piwi-interacting RNA (piRNA) pathway, which mediates the repression of transposable elements during meiosis by forming complexes composed of piRNAs and Piwi proteins. Interacts with Piwi proteins and directly binds piRNAs, a class of 24 to 30 nucleotide RNAs that are generated by a Dicer-independent mechanism and are primarily derived from transposons and other repeated sequence elements (PubMed:28254886).[UniProtKB/Swiss-Prot Function]
