Gene Summary:Transcription factor, which binds preferentially the consensus sequence 5'-TAAGT[AG]-3' and
can behave as a transcriptional repressor (By similarity). Plays an important role in normal
prostate development, regulating proliferation of glandular epithelium and in the formation
of ducts in prostate. Acts as a tumor suppressor controlling prostate carcinogenesis, as
shown by the ability to suppress growth and tumorigenicity of prostate carcinoma cells. Plays
a role in the formation of minor salivary glands (particularly palatine and lingual glands).
Essential for appropriate differentiation and secretory function of the bulbourethral gland.
[UniProtKB/Swiss-Prot Function]
