Gene Summary:This gene encodes a double-stranded-RNA-specific adenosine deaminase that is involved in
editing pre-mRNAs by site-specific conversion of adenosine (A) to inosine (I). Substrates for
this enzyme include ionotropic glutamate receptors (GluR2-6) and serotonin receptor
(5HT2C). Studies in rodents have shown that this protein can modify its own pre-mRNA by A-
>I editing to create a novel acceptor splice site, alternative splicing to which results in down
regulation of its protein expression. Additional splicing events result in transcript variants
encoding different isoforms. [provided by RefSeq, Jul 2008]
