| Gene Summary: | during the late stage of clathrin-mediated endocytosis. Binds to lipids such as<br>phosphatidylinositol 4,5-bisphosphate and phosphatidylserine and promotes membrane<br>invagination and the formation of tubules. Also enhances actin polymerization via the<br>recruitment of WASL/N-WASP, which in turn activates the Arp2/3 complex. Actin<br>polymerization may promote the fission of membrane tubules to form endocytic vesicles.<br>May act as a link between RND2 signaling and regulation of the actin cytoskeleton. May be |
