## Crbn (NM\_021449) Mouse Tagged ORF Clone Lentiviral Particle

**Product data:** 

Product Type: Lentiviral Particles

**Product Name:** Crbn (NM\_021449) Mouse Tagged ORF Clone Lentiviral Particle

Symbol: Crbr

**Synonyms:** 2610203G15Rik; 2900045O07Rik; AF229032; AW108261; piL

Mammalian Cell

Selection:

Puromycin

**Vector:** pLenti-C-Myc-DDK-P2A-Puro (PS100092)

 Tag:
 Myc-DDK

 ACCN:
 NM\_021449

ORF Size: 1332 bp

**ORF Nucleotide** 

The ORF insert of this clone is exactly the same as(MR225532).

Sequence:

OTI Disclaimer: The molecular sequence of this clone aligns with the gene accession number as a point of reference only. However, individual transcript sequences of the same gene can differ through naturally occurring variations (e.g. polymorphisms), each with its own valid existence. This clone is substantially in agreement with the reference, but a complete review of all prevailing

variants is recommended prior to use. More info

**OTI Annotation:** This clone was engineered to express the complete ORF with an expression tag. Expression

varies depending on the nature of the gene.

**RefSeg:** NM 021449.2, NP 067424.2

 RefSeq Size:
 4051 bp

 RefSeq ORF:
 1335 bp

 Locus ID:
 58799

 UniProt ID:
 Q8C7D2

Cytogenetics: 6 E1

## **Gene Summary:**

This gene encodes a protein with a Lon protease domain, a "regulators of G protein-signaling" (RGS)-like domain and a leucine zipper. It has been proposed to regulate the assembly and surface expression of large-conductance calcium-activated potassium channels in brain and to bind thalidomide. In humans mutation in this gene causes autosomal recessive nonsyndromic cognitive disability. In mouse deficiency of this gene serves as a model to study the molecular mechanisms governing learning and memory as they relate to intellectual disability. Alternative splicing results in multiple transcript variants that encode different protein isoforms. [provided by RefSeq, Jan 2013]
