However, individual transcript sequences of the same gene can differ through naturally occurring variations (e.g. polymorphisms), each with its own valid existence. This clone is substantially in agreement with the reference, but a complete review of all prevailing variants is recommended prior to use. <u>More info</u>
OTI Annotation:	This clone was engineered to express the complete ORF with an expression tag. Expression varies depending on the nature of the gene.

Gene Summary:This gene encodes a member of the semaphorin family of proteins that have diverse
functions in neuronal development, heart morphogenesis, vascular growth, tumor
progression and immune cell regulation. Lack of the encoded protein in some mice causes
exencephaly resulting in neonatal lethality. Mice that bypass exencephaly show no obvious
behavioral defects but display distinct pigmentation defects. Alternative splicing of this gene
results in multiple transcript variants. [provided by RefSeq, Jan 2015]
