#### **GRIGENE** MRPS6 (NM\_032476) Human Mass Spec Standard – PH304000

Summary:Mammalian mitochondrial ribosomal proteins are encoded by nuclear genes and help in<br/>protein synthesis within the mitochondrion. Mitochondrial ribosomes (mitoribosomes)<br/>consist of a small 28S subunit and a large 39S subunit. They have an estimated 75% protein<br/>to rRNA composition compared to prokaryotic ribosomes, where this ratio is reversed.<br/>Another difference between mammalian mitoribosomes and prokaryotic ribosomes is that<br/>the latter contain a 5S rRNA. Among different species, the proteins comprising the<br/>mitoribosome differ greatly in sequence, and sometimes in biochemical properties, which<br/>prevents easy recognition by sequence homology. This gene encodes a 28S subunit protein<br/>that belongs to the ribosomal protein S6P family. Pseudogenes corresponding to this gene<br/>are found on chromosomes 1p and 12q.
