Cofilin 2 (CFL2) (NM_021914) Human Mass Spec Standard - PH305105

Cytogenetics: 14q13.1

Summary: This gene encodes an intracellular protein that is involved in the regulation of actin-filament

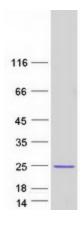

dynamics. This protein is a major component of intranuclear and cytoplasmic actin rods. It can bind G- and F-actin in a 1:1 ratio of cofilin to actin, and it reversibly controls actin polymerization and depolymerization in a pH-dependent manner. Mutations in this gene cause nemaline myopathy type 7, a form of congenital myopathy. Alternative splicing results

in multiple transcript variants. [provided by RefSeq, Jul 2009]

Protein Families: Druggable Genome

Protein Pathways: Axon guidance, Fc gamma R-mediated phagocytosis, Regulation of actin cytoskeleton
