	LMO2 (NM_005574) Human Mass Spec Standard – PH305376
Cytogenetics:	11p13
Summary:	LMO2 encodes a cysteine-rich, two LIM-domain protein that is required for yolk sac erythropoiesis. The LMO2 protein has a central and crucial role in hematopoietic development and is highly conserved. The LMO2 transcription start site is located approximately 25 kb downstream from the 11p13 T-cell translocation cluster (11p13 ttc), where a number T-cell acute lymphoblastic leukemia-specific translocations occur. Alternative splicing results in multiple transcript variants encoding different isoforms.[provided by RefSeq, Nov 2008]
Protein Families	: Druggable Genome

Product images:

Coomassie blue staining of purified LMO2 protein (Cat# [TP305376]). The protein was produced from HEK293T cells transfected with LMO2 cDNA clone (Cat# [RC205376]) using MegaTran 2.0 (Cat# [TT210002]).
