Synonyms: SLEB10 Locus ID: 3663

UniProt ID: Q13568, <u>B7Z1M2</u>

Cytogenetics: 7q32.1

Summary: This gene encodes a member of the interferon regulatory factor (IRF) family, a group of

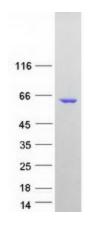

transcription factors with diverse roles, including virus-mediated activation of interferon, and modulation of cell growth, differentiation, apoptosis, and immune system activity. Members of the IRF family are characterized by a conserved N-terminal DNA-binding domain containing tryptophan (W) repeats. Alternative promoter use and alternative splicing result in multiple transcript variants, and a 30-nt indel polymorphism (SNP rs60344245) can result in loss of a

10-aa segment. [provided by RefSeq, Dec 2016]

Protein Families: Transcription Factors
