Cytogenetics: 1q23.3

**Summary:** The protein encoded by this gene is a low affinity receptor for the Fc region of immunoglobulin gamma complexes. The encoded protein is involved in the phagocytosis of immune complexes and in the regulation of antibody production by B-cells. Variations in this gene may increase susceptibility to systemic lupus erythematosus (SLE). Several transcript variants encoding different isoforms have been found for this gene. [provided by RefSeq, Jun 2010]

**Protein Families:** ES Cell Differentiation/IPS, Transmembrane

**Protein Pathways:** B cell receptor signaling pathway, Fc gamma R-mediated phagocytosis, Systemic lupus erythematosus
