	UBE2I (NM_194260) Human Mass Spec Standard – PH324182
Cytogenetics:	16p13.3
Summary:	The modification of proteins with ubiquitin is an important cellular mechanism for targeting abnormal or short-lived proteins for degradation. Ubiquitination involves at least three classes of enzymes: ubiquitin-activating enzymes, or E1s, ubiquitin-conjugating enzymes, or E2s, and ubiquitin-protein ligases, or E3s. This gene encodes a member of the E2 ubiquitin- conjugating enzyme family. Four alternatively spliced transcript variants encoding the same protein have been found for this gene.
