GDAP1L1 (NM_024034) Human Tagged Lenti ORF Clone

Product data:

Product Type: Expression Plasmids

Product Name: GDAP1L1 (NM_024034) Human Tagged Lenti ORF Clone

Tag: mGFP

Symbol: GDAP1L1

Synonyms: dJ881L22.1; dJ995J12.1.1

Mammalian Cell Puromycin

Selection:

Vector: pLenti-C-mGFP-P2A-Puro (PS100093)

E. coli Selection: Chloramphenicol (34 ug/mL)

ORF Nucleotide

The ORF insert of this clone is exactly the same as(RC200976).

Sequence:

Restriction Sites: Sgfl-Mlul

Cloning Scheme:

^{*} The last codon before the Stop codon of the ORF

ACCN: NM_024034

ORF Size: 1101 bp

GDAP1L1 (NM_024034) Human Tagged Lenti ORF Clone - RC200976L4

OTI Disclaimer: The molecular sequence of this clone aligns with the gene accession number as a point of

reference only. However, individual transcript sequences of the same gene can differ through naturally occurring variations (e.g. polymorphisms), each with its own valid existence. This clone is substantially in agreement with the reference, but a complete review of all prevailing

variants is recommended prior to use. More info

OTI Annotation: This clone was engineered to express the complete ORF with an expression tag. Expression

varies depending on the nature of the gene.

Components: The ORF clone is ion-exchange column purified and shipped in a 2D barcoded Matrix tube

containing 10ug of transfection-ready, dried plasmid DNA (reconstitute with 100 ul of water).

Reconstitution Method: 1. Centrifuge at 5,000xg for 5min.

2. Carefully open the tube and add 100ul of sterile water to dissolve the DNA.

3. Close the tube and incubate for 10 minutes at room temperature.

4. Briefly vortex the tube and then do a quick spin (less than 5000xg) to concentrate the liquid

at the bottom.

5. Store the suspended plasmid at -20°C. The DNA is stable for at least one year from date of

shipping when stored at -20°C.

RefSeq: <u>NM 024034.3</u>

 RefSeq Size:
 2798 bp

 RefSeq ORF:
 1104 bp

 Locus ID:
 78997

 UniProt ID:
 Q96MZ0

Cytogenetics: 20q13.12

Protein Families: Transmembrane

MW: 42 kDa

Gene Summary: The ganglioside GD3 synthase causes cell differentiation with neurite sprouting when

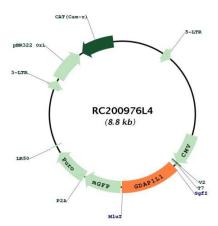

transfected into the mouse neuroblastoma cell line Neuro2a. After differentiation, the expression of several genes is upregulated, including one that encodes a protein termed ganglioside-induced differentiation-associated protein 1 (Gdap1). A similar gene was found in humans, and mutations in the human gene are associated with Charcot-Marie-Tooth type 4A disease. The protein encoded by this gene is similar in sequence to the human GDAP1

transcript variant, have been found for this gene. [provided by RefSeq, Feb 2012]

protein. Several transcript variants encoding different isoforms, as well as a noncoding
