PRP18 homolog (PRPF18) (NM_003675) Human Tagged Lenti ORF Clone

Product data:

Product Type: Expression Plasmids

Product Name: PRP18 homolog (PRPF18) (NM_003675) Human Tagged Lenti ORF Clone

Tag: mGFP

Symbol: PRP18 homolog
Synonyms: hPrp18; PRP18

Mammalian Cell Puromycin

Selection:

Vector: pLenti-C-mGFP-P2A-Puro (PS100093)

E. coli Selection: Chloramphenicol (34 ug/mL)

ORF Nucleotide The ORF insert of this clo

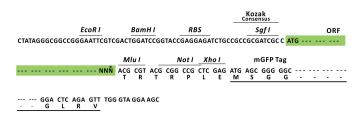

Sequence:

The ORF insert of this clone is exactly the same as(RC201556).

Restriction Sites: Sgfl-Mlul

Cloning Scheme:

^{*} The last codon before the Stop codon of the ORF

ACCN: NM_003675

ORF Size: 1026 bp

PRP18 homolog (PRPF18) (NM_003675) Human Tagged Lenti ORF Clone - RC201556L4

OTI Disclaimer: The molecular sequence of this clone aligns with the gene accession number as a point of

reference only. However, individual transcript sequences of the same gene can differ through naturally occurring variations (e.g. polymorphisms), each with its own valid existence. This clone is substantially in agreement with the reference, but a complete review of all prevailing

variants is recommended prior to use. More info

OTI Annotation: This clone was engineered to express the complete ORF with an expression tag. Expression

varies depending on the nature of the gene.

Components: The ORF clone is ion-exchange column purified and shipped in a 2D barcoded Matrix tube

containing 10ug of transfection-ready, dried plasmid DNA (reconstitute with 100 ul of water).

Reconstitution Method: 1. Centrifuge at 5,000xg for 5min.

2. Carefully open the tube and add 100ul of sterile water to dissolve the DNA.

3. Close the tube and incubate for 10 minutes at room temperature.

4. Briefly vortex the tube and then do a quick spin (less than 5000xg) to concentrate the liquid

at the bottom.

5. Store the suspended plasmid at -20°C. The DNA is stable for at least one year from date of

shipping when stored at -20°C.

RefSeq: <u>NM 003675.3</u>

RefSeq Size: 1711 bp
RefSeq ORF: 1029 bp
Locus ID: 8559

UniProt ID: Q99633

Cytogenetics: 10p13

Domains: SFM, Prp18Protein Pathways: SpliceosomeMW: 39.9 kDa

Gene Summary: Pre-mRNA splicing occurs in 2 sequential transesterification steps. The protein encoded by

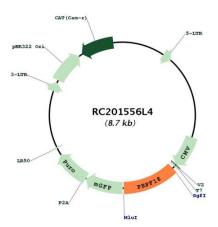

this gene is found to be essential for the catalytic step II in pre-mRNA splicing process. It is found in the spliceosome, and contains seven WD repeats, which function in protein-protein

interactions. This protein has a sequence similarity to the yeast splicing factor Prp18.
