| OTI Disclaimer:              | The molecular sequence of this clone aligns with the gene accession number as a point of reference only. However, individual transcript sequences of the same gene can differ through naturally occurring variations (e.g. polymorphisms), each with its own valid existence. This clone is substantially in agreement with the reference, but a complete review of all prevailing variants is recommended prior to use. <u>More info</u> |
| OTI Annotation:              | This clone was engineered to express the complete ORF with an expression tag. Expression varies depending on the nature of the gene.  |

| Gene Summary: | The C/EBP family of transcription factors regulates viral and cellular CCAAT/enhancer<br>element-mediated transcription. C/EBP proteins contain the bZIP region, which is<br>characterized by two motifs in the C-terminal half of the protein: a basic region involved in<br>DNA binding and a leucine zipper motif involved in dimerization. The C/EBP family consist of<br>several related proteins, C/EBP alpha, C/EBP beta, C/EBP gamma, and C/EBP delta, that form<br>homodimers and that form heterodimers with each other. CCAAT/enhancer binding protein<br>gamma may cooperate with Fos to bind PRE-I enhancer elements. Two transcript variants<br>encoding the same protein have been found for this gene.
