## TCTP (TPT1) (NM\_003295) Human Tagged ORF Clone Lentiviral Particle

**Product data:** 

Product Type: Lentiviral Particles

**Product Name:** TCTP (TPT1) (NM\_003295) Human Tagged ORF Clone Lentiviral Particle

Symbol: TCTF

Synonyms: HRF; p02; p23; TCTP

Mammalian Cell

Selection:

None

**Vector:** pLenti-C-mGFP (PS100071)

Tag: mGFP

**ACCN:** NM\_003295

ORF Size: 516 bp

**ORF Nucleotide** 

The ORF insert of this clone is exactly the same as(RC201664).

Sequence:

**UniProt ID:** 

OTI Disclaimer: The molecular sequence of this clone aligns with the gene accession number as a point of

reference only. However, individual transcript sequences of the same gene can differ through naturally occurring variations (e.g. polymorphisms), each with its own valid existence. This clone is substantially in agreement with the reference, but a complete review of all prevailing

variants is recommended prior to use. More info

**OTI Annotation:** This clone was engineered to express the complete ORF with an expression tag. Expression

varies depending on the nature of the gene.

**RefSeg:** NM 003295.1

RefSeq Size:4649 bpRefSeq ORF:519 bpLocus ID:7178

Cytogenetics: 13q14.13

P13693

Domains: TCTP

**MW:** 19.6 kDa

## **Gene Summary:**

This gene encodes a protein that is a regulator of cellular growth and proliferation. Its mRNA is highly structured and contains an oligopyrimidine tract (5'-TOP) in its 5' untranslated region that functions to repress its translation under quiescent conditions. The encoded protein is involved in a variety of cellular pathways, including apoptosis, protein synthesis and cell division. It binds to and stabilizes microtubules, and removal of this protein through phosphorylation is required for progression through mitotic and meiotic cell divisions. This gene is known to play a role in carcinogenesis, and is upregulated in some cancer cells. Alternative splicing results in multiple transcript variants encoding different isoforms. [provided by RefSeq, Aug 2017]
