Protein Pathways: Spliceosome

MW: 92.3 kDa

Gene Summary: The protein encoded by this gene shares a significant similarity with *Schizosaccharomyces pombe cdc5* gene product, which is a cell cycle regulator important for G2/M transition. This protein has been demonstrated to act as a positive regulator of cell cycle G2/M progression. It was also found to be an essential component of a non-snRNA spliceosome, which contains at least five additional protein factors and is required for the second catalytic step of pre-mRNA splicing.
