OTI Disclaimer:

The molecular sequence of this clone aligns with the gene accession number as a point of reference only. However, individual transcript sequences of the same gene can differ through naturally occurring variations (e.g. polymorphisms), each with its own valid existence. This clone is substantially in agreement with the reference, but a complete review of all prevailing

variants is recommended prior to use. More info

**OTI Annotation:** This clone was engineered to express the complete ORF with an expression tag. Expression

varies depending on the nature of the gene.

## PAR2 (F2RL1) (NM\_005242) Human Tagged ORF Clone Lentiviral Particle - RC202121L3V

**Protein Pathways:** Neuroactive ligand-receptor interaction

MW: 44.1 kDa

**Gene Summary:** This gene encodes a member of the G-protein coupled receptor 1 family of proteins. The

encoded cell surface receptor is activated through proteolytic cleavage of its extracellular amino terminus, resulting in a new amino terminus that acts as a tethered ligand that binds to an extracellular loop domain. Activation of the receptor has been shown to stimulate vascular smooth muscle relaxation, dilate blood vessels, increase blood flow, and lower blood pressure. This protein is also important in the inflammatory response, as well as innate and

adaptive immunity. [provided by RefSeq, Jun 2016]
