CPSF7 (NM_024811) Human Tagged Lenti ORF Clone

Product data:

Product Type: Expression Plasmids

Product Name: CPSF7 (NM_024811) Human Tagged Lenti ORF Clone

Tag:mGFPSymbol:CPSF7Synonyms:CFIm59

Mammalian Cell Puromycin

Selection:

Vector: pLenti-C-mGFP-P2A-Puro (PS100093)

E. coli Selection: Chloramphenicol (34 ug/mL)

ORF Nucleotide The ORF insert of this clone is exactly the same as(RC202127).

Sequence:

Restriction Sites: Sgfl-Mlul

Cloning Scheme:

^{*} The last codon before the Stop codon of the ORF

ACCN: NM_024811

ORF Size: 1413 bp

CPSF7 (NM_024811) Human Tagged Lenti ORF Clone - RC202127L4

OTI Disclaimer: The molecular sequence of this clone aligns with the gene accession number as a point of

> reference only. However, individual transcript sequences of the same gene can differ through naturally occurring variations (e.g. polymorphisms), each with its own valid existence. This clone is substantially in agreement with the reference, but a complete review of all prevailing

variants is recommended prior to use. More info

OTI Annotation: This clone was engineered to express the complete ORF with an expression tag. Expression

varies depending on the nature of the gene.

Components: The ORF clone is ion-exchange column purified and shipped in a 2D barcoded Matrix tube

containing 10ug of transfection-ready, dried plasmid DNA (reconstitute with 100 ul of water).

Reconstitution Method: 1. Centrifuge at 5,000xg for 5min.

2. Carefully open the tube and add 100ul of sterile water to dissolve the DNA.

3. Close the tube and incubate for 10 minutes at room temperature.

4. Briefly vortex the tube and then do a quick spin (less than 5000xg) to concentrate the liquid

at the bottom.

5. Store the suspended plasmid at -20°C. The DNA is stable for at least one year from date of

shipping when stored at -20°C.

NM 024811.2, NP 079087.2 RefSeq:

RRM

52.1 kDa

RefSeq Size: 3764 bp RefSeq ORF: 1545 bp Locus ID: 79869 **UniProt ID:** Q8N684

Cytogenetics: 11q12.2

MW:

Domains:

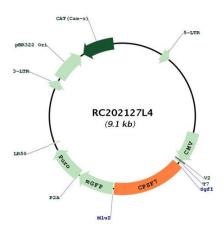

Gene Summary: Cleavage factor Im (CFIm) is one of six factors necessary for correct cleavage and

> polyadenylation of pre-mRNAs. CFIm is composed of three different subunits of 25, 59, and 68 kDa, and it functions as a heterotetramer, with a dimer of the 25 kDa subunit binding to two of the 59 or 68 kDa subunits. The protein encoded by this gene represents the 59 kDa subunit, which can interact with the splicing factor U2 snRNP Auxiliary Factor (U2AF) 65 to link

the splicing and polyadenylation complexes. [provided by RefSeq, Oct 2016]
