### RNPC3 (NM\_017619) Human Tagged Lenti ORF Clone

#### **Product data:**

**Product Type:** Expression Plasmids

Product Name: RNPC3 (NM\_017619) Human Tagged Lenti ORF Clone

Tag: Myc-DDK

Symbol: RNPC3

**Synonyms:** IGHD5; RBM40; RNP; SNRNP65

Mammalian Cell None

Selection:

Vector:pLenti-C-Myc-DDK (PS100064)E. coli Selection:Chloramphenicol (34 ug/mL)

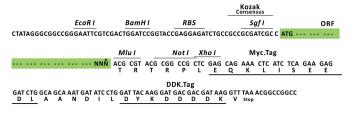

ORF Nucleotide The ORF insert of this clone is exactly the same as(RC202319).

Sequence:

**Restriction Sites:** Sgfl-Mlul

**Cloning Scheme:** 

<sup>\*</sup> The last codon before the Stop codon of the ORF

**ACCN:** NM\_017619

ORF Size: 1551 bp

#### RNPC3 (NM\_017619) Human Tagged Lenti ORF Clone - RC202319L1

**OTI Disclaimer:** The molecular sequence of this clone aligns with the gene accession number as a point of

reference only. However, individual transcript sequences of the same gene can differ through naturally occurring variations (e.g. polymorphisms), each with its own valid existence. This clone is substantially in agreement with the reference, but a complete review of all prevailing

variants is recommended prior to use. More info

**OTI Annotation:** This clone was engineered to express the complete ORF with an expression tag. Expression

varies depending on the nature of the gene.

**Components:** The ORF clone is ion-exchange column purified and shipped in a 2D barcoded Matrix tube

containing 10ug of transfection-ready, dried plasmid DNA (reconstitute with 100 ul of water).

**Reconstitution Method:** 1. Centrifuge at 5,000xg for 5min.

2. Carefully open the tube and add 100ul of sterile water to dissolve the DNA.

3. Close the tube and incubate for 10 minutes at room temperature.

4. Briefly vortex the tube and then do a quick spin (less than 5000xg) to concentrate the liquid

at the bottom.

5. Store the suspended plasmid at -20°C. The DNA is stable for at least one year from date of

shipping when stored at -20°C.

**RefSeq:** <u>NM 017619.3</u>

RefSeq Size: 1901 bp
RefSeq ORF: 1554 bp
Locus ID: 55599
UniProt ID: Q96LT9
Cytogenetics: 1p21.1

**MW:** 58.6 kDa

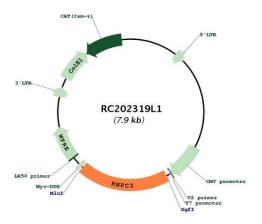

**Gene Summary:** Two types of spliceosomes catalyze splicing of pre-mRNAs. The major U2-type spliceosome is

found in all eukaryotes and removes U2-type introns, which represent more than 99% of premRNA introns. The minor U12-type spliceosome is found in some eukaryotes and removes U12-type introns, which are rare and have distinct splice consensus signals. The U12-type spliceosome consists of several small nuclear RNAs and associated proteins. This gene encodes a 65K protein that is a component of the U12-type spliceosome. This protein contains two RNA recognition motifs (RRMs), suggesting that it may contact one of the small

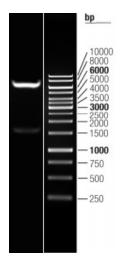

nuclear RNAs of the minor spliceosome. [provided by RefSeq, Jul 2008]
