Product datasheet for RC202471L3V

MAGEA11 (NM_005366) Human Tagged ORF Clone Lentiviral Particle

Product data:

Product Type:	Lentiviral Particles
Product Name:	MAGEA11 (NM_005366) Human Tagged ORF Clone Lentiviral Particle
Symbol:	MAGEA11
Synonyms:	CT1.11; MAGE-11; MAGE11; MAGEA-11
Mammalian Cell Selection:	Puromycin
Vector:	pLenti-C-Myc-DDK-P2A-Puro (PS100092)
Tag:	Myc-DDK
ACCN:	NM_005366
ORF Size:	1287 bp
ORF Nucleotide Sequence:	The ORF insert of this clone is exactly the same as(RC202471).
OTI Disclaimer:	The molecular sequence of this clone aligns with the gene accession number as a point of reference only. However, individual transcript sequences of the same gene can differ through naturally occurring variations (e.g. polymorphisms), each with its own valid existence. This clone is substantially in agreement with the reference, but a complete review of all prevailing variants is recommended prior to use. <u>More info</u>
OTI Annotation:	This clone was engineered to express the complete ORF with an expression tag. Expression varies depending on the nature of the gene.
RefSeq:	<u>NM 005366.4</u>
RefSeq Size:	1892 bp
RefSeq ORF:	1290 bp
Locus ID:	4110
UniProt ID:	<u>P43364</u>
Cytogenetics:	Xq28
MW:	48.1 kDa

This product is to be used for laboratory only. Not for diagnostic or therapeutic use. ©2022 OriGene Technologies, Inc., 9620 Medical Center Drive, Ste 200, Rockville, MD 20850, US

Gene Summary:This gene is a member of the MAGEA gene family. The members of this family encode
proteins with 50 to 80% sequence identity to each other. The promoters and first exons of the
MAGEA genes show considerable variability, suggesting that the existence of this gene family
enables the same function to be expressed under different transcriptional controls. The
MAGEA genes are clustered at chromosomal location Xq28. They have been implicated in
some hereditary disorders, such as dyskeratosis congenita. Two transcript variants encoding
different isoforms have been found for this gene. [provided by RefSeq, Jul 2008]
