| OTI Disclaimer:              | The molecular sequence of this clone aligns with the gene accession number as a point of reference only. However, individual transcript sequences of the same gene can differ through naturally occurring variations (e.g. polymorphisms), each with its own valid existence. This clone is substantially in agreement with the reference, but a complete review of all prevailing variants is recommended prior to use. <u>More info</u> |
| OTI Annotation:              | This clone was engineered to express the complete ORF with an expression tag. Expression varies depending on the nature of the gene.  |

| Gene Summary: | This gene encodes a member of the pancreatic-type of secretory ribonucleases, a subset of<br>the ribonuclease A superfamily. The encoded endonuclease cleaves internal phosphodiester<br>RNA bonds on the 3'-side of pyrimidine bases. It prefers poly(C) as a substrate and hydrolyzes<br>2',3'-cyclic nucleotides, with a pH optimum near 8.0. The encoded protein is monomeric and<br>more commonly acts to degrade ds-RNA over ss-RNA. Alternative splicing occurs at this locus<br>and four transcript variants encoding the same protein have been identified. [provided by<br>RefSeq, Jul 2008] |
