MRPS30 (NM_016640) Human Tagged ORF Clone Lentiviral Particle – RC202830L3V

Gene Summary:Mammalian mitochondrial ribosomal proteins are encoded by nuclear genes and help in
protein synthesis within the mitochondrion. Mitochondrial ribosomes (mitoribosomes)
consist of a small 28S subunit and a large 39S subunit. They have an estimated 75% protein
to rRNA composition compared to prokaryotic ribosomes, where this ratio is reversed.
Another difference between mammalian mitoribosomes and prokaryotic ribosomes is that
the latter contain a 5S rRNA. Among different species, the proteins comprising the
mitoribosome differ greatly in sequence, and sometimes in biochemical properties, which
prevents easy recognition by sequence homology. This gene encodes a 28S subunit protein
that is similar to the chicken pro-apoptotic protein p52. Transcript variants using alternative
promoters or polyA sites have been mentioned in the literature but the complete description
of these sequences is not available. [provided by RefSeq, Jul 2008]
