| OTI Disclaimer:              | The molecular sequence of this clone aligns with the gene accession number as a point of reference only. However, individual transcript sequences of the same gene can differ through naturally occurring variations (e.g. polymorphisms), each with its own valid existence. This clone is substantially in agreement with the reference, but a complete review of all prevailing variants is recommended prior to use. <u>More info</u> |
| OTI Annotation:              | This clone was engineered to express the complete ORF with an expression tag. Expression varies depending on the nature of the gene.  |

| Protein Pathway | s: Notch signaling pathway  |
| MW:             | 54.1 kDa  |
| Gene Summary:   | The protein encoded by this gene is a transcriptional regulator important in the Notch<br>signaling pathway. The encoded protein acts as a repressor when not bound to Notch<br>proteins and an activator when bound to Notch proteins. It is thought to function by<br>recruiting chromatin remodeling complexes containing histone deacetylase or histone<br>acetylase proteins to Notch signaling pathway genes. Several transcript variants encoding<br>different isoforms have been found for this gene, and several pseudogenes of this gene exist<br>on chromosome 9. [provided by RefSeq, Oct 2013] |
