SRPK2 (NM_182691) Human Tagged Lenti ORF Clone

Product data:

Product Type: Expression Plasmids

Product Name: SRPK2 (NM_182691) Human Tagged Lenti ORF Clone

Tag:mGFPSymbol:SRPK2Synonyms:SFRSK2

Mammalian Cell Puromycin

Selection:

Vector: pLenti-C-mGFP-P2A-Puro (PS100093)

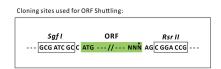

E. coli Selection: Chloramphenicol (34 ug/mL)

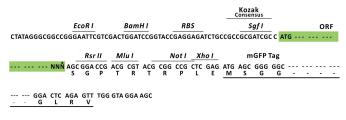

ORF Nucleotide The ORF insert of this clone is exactly the same as(RC205134).

Sequence:

Restriction Sites: Sgfl-Rsrll

Cloning Scheme:

^{*} The last codon before the Stop codon of the ORF

ACCN: NM_182691

ORF Size: 2064 bp

SRPK2 (NM_182691) Human Tagged Lenti ORF Clone - RC205134L4

OTI Disclaimer: The molecular sequence of this clone aligns with the gene accession number as a point of

reference only. However, individual transcript sequences of the same gene can differ through naturally occurring variations (e.g. polymorphisms), each with its own valid existence. This clone is substantially in agreement with the reference, but a complete review of all prevailing

variants is recommended prior to use. More info

OTI Annotation: This clone was engineered to express the complete ORF with an expression tag. Expression

varies depending on the nature of the gene.

Components: The ORF clone is ion-exchange column purified and shipped in a 2D barcoded Matrix tube

containing 10ug of transfection-ready, dried plasmid DNA (reconstitute with 100 ul of water).

Reconstitution Method: 1. Centrifuge at 5,000xg for 5min.

2. Carefully open the tube and add 100ul of sterile water to dissolve the DNA.

3. Close the tube and incubate for 10 minutes at room temperature.

4. Briefly vortex the tube and then do a quick spin (less than 5000xg) to concentrate the liquid

at the bottom.

5. Store the suspended plasmid at -20°C. The DNA is stable for at least one year from date of

shipping when stored at -20°C.

RefSeq: NM 182691.1

RefSeq Size:3780 bpRefSeq ORF:2067 bpLocus ID:6733

 UniProt ID:
 P78362

 Cytogenetics:
 7q22.3

Protein Families: Druggable Genome, Protein Kinase

MW: 77.5 kDa

Gene Summary: Serine/arginine-rich protein-specific kinase which specifically phosphorylates its substrates at

and is involved in the phosphorylation of SR splicing factors and the regulation of splicing. Promotes neuronal apoptosis by up-regulating cyclin-D1 (CCND1) expression. This is done by the phosphorylation of SRSF2, leading to the suppression of p53/TP53 phosphorylation thereby relieving the repressive effect of p53/TP53 on cyclin-D1 (CCND1) expression. Phosphorylates ACIN1, and redistributes it from the nuclear speckles to the nucleoplasm, resulting in cyclin A1 but not cyclin A2 up-regulation. Plays an essential role in spliceosomal B

serine residues located in regions rich in arginine/serine dipeptides, known as RS domains

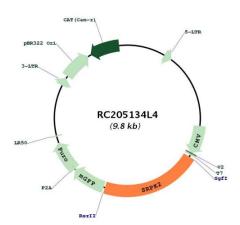

(HBV) core protein phosphorylation. Plays a negative role in the regulation of HBV replication through a mechanism not involving the phosphorylation of the core protein but by reducing the packaging efficiency of the pregenomic RNA (pgRNA) without affecting the formation of

complex formation via the phosphorylation of DDX23/PRP28. Can mediate hepatitis B virus

the viral core particles.[UniProtKB/Swiss-Prot Function]
