Gene Summary:The reversible posttranslational modification of proteins by the addition of small ubiquitin-
like SUMO proteins (see SUMO1; MIM 601912) is required for numerous biologic processes.
SUMO-specific proteases, such as SENP5, are responsible for the initial processing of SUMO
precursors to generate a C-terminal diglycine motif required for the conjugation reaction.
They also have isopeptidase activity for the removal of SUMO from high molecular mass
SUMO conjugates (Di Bacco et al., 2006 [PubMed 16738315]).[supplied by OMIM, Jun 2009]
