LRRC2 (NM_024750) Human Tagged ORF Clone Lentiviral Particle

Product data:

Product Type: Lentiviral Particles

Product Name: LRRC2 (NM_024750) Human Tagged ORF Clone Lentiviral Particle

Symbol: LRRC2

Synonyms: leucine-rich repeat-containing 2; leucine rich repeat containing 2

Mammalian Cell

Selection:

None

Vector: pLenti-C-Myc-DDK (PS100064)

Tag: Myc-DDK
ACCN: NM 024750

ORF Size: 1113 bp

ORF Nucleotide

The ORF insert of this clone is exactly the same as(RC206380).

Sequence:

OTI Disclaimer: The molecular sequence of this clone aligns with the gene accession number as a point of reference only. However, individual transcript sequences of the same gene can differ through naturally occurring variations (e.g. polymorphisms), each with its own valid existence. This

clone is substantially in agreement with the reference, but a complete review of all prevailing

variants is recommended prior to use. <u>More info</u>

OTI Annotation: This clone was engineered to express the complete ORF with an expression tag. Expression

varies depending on the nature of the gene.

RefSeq: <u>NM 024750.2</u>

RefSeq Size: 4909 bp
RefSeq ORF: 1115 bp
Locus ID: 79442
Cytogenetics: 3p21.31

Domains: LRR, LRR_TYP, LRR_PS
Protein Families: Druggable Genome

MW: 42.9 kDa

Gene Summary:

This gene encodes a member of the leucine-rich repeat-containing family of proteins, which function in diverse biological pathways. This family member may possibly be a nuclear protein. Similarity to the RAS suppressor protein, as well as expression down-regulation observed in tumor cells, suggests that it may function as a tumor suppressor. The gene is located in the chromosome 3 common eliminated region 1 (C3CER1), a 1.4 Mb region that is commonly deleted in diverse tumors. A related pseudogene has been identified on chromosome 2. [provided by RefSeq, Sep 2011]
