Gene Summary:The protein encoded by this gene interacts with the cytoplasmic domains of amyloid beta (A4)
precursor protein and amyloid beta (A4) precursor-like protein 2. This protein contains two
phosphotyrosine binding (PTB) domains, which are thought to function in signal transduction.
Polymorphisms in this gene have been associated with Alzheimer's disease. Alternative
splicing results in multiple transcript variants. [provided by RefSeq, Oct 2009]
