Gene Summary:This gene is a member of the septin family of GTPases. Members of this family are required<br/>for cytokinesis. One version of pediatric acute myeloid leukemia is the result of a reciprocal<br/>translocation between chromosomes 11 and X, with the breakpoint associated with the genes<br/>encoding the mixed-lineage leukemia and septin 2 proteins. This gene encodes four<br/>transcript variants encoding three distinct isoforms. An additional transcript variant has been<br/>identified, but its biological validity has not been determined.
