Gene Summary:This gene encodes an integral membrane protein that is secreted from intracellular zymogen<br/>granules and associates with the plasma membrane via glycosylphosphatidylinositol (GPI)<br/>linkage. The encoded protein binds pathogens such as enterobacteria, thereby playing an<br/>important role in the innate immune response. The C-terminus of this protein is related to<br/>the C-terminus of the protein encoded by the neighboring gene, uromodulin (UMOD).<br/>Alternative splicing results in multiple transcript variants.
