Gene Summary:The protein encoded by this gene is a type I transmembrane glycoprotein which shows<br/>homology to the pMEL17 precursor, a melanocyte-specific protein. GPNMB shows expression<br/>in the lowly metastatic human melanoma cell lines and xenografts but does not show<br/>expression in the highly metastatic cell lines. GPNMB may be involved in growth delay and<br/>reduction of metastatic potential. Two transcript variants encoding different isoforms have<br/>been found for this gene. [provided by RefSeq, Jul 2008]
