CRIGENE NKX2.8 (NKX2-8) (NM_014360) Human Tagged ORF Clone Lentiviral Particle – RC207752L2

Gene Summary:The protein encoded by this gene is a homeobox-containing developmental regulator
associated with liver development. The encoded protein binds to the alpha-fetoprotein (AFP)
gene promoter and increases the expression of AFP. This gene is overexpressed in some lung
cancers and is linked to poor patient survival, possibly due to its resistance to cisplatin. This
gene is aberrantly methylated in pancreatic cancer, deleted in squamous cell lung
carcinomas, and acts as a tumor suppressor in esophageal cancer. Mutations in this gene
may also be a cause of neural tube defects. [provided by RefSeq, Dec 2015]
