**Protein Families:** Druggable Genome, Transcription Factors

**Protein Pathways:** Jak-STAT signaling pathway

**MW:** 43.7 kDa

**Gene Summary:** This gene encodes a member of the interferon regulatory factor (IRF) family, a group of transcription factors with diverse roles, including virus-mediated activation of interferon, and modulation of cell growth, differentiation, apoptosis, and immune system activity. Members of the IRF family are characterized by a conserved N-terminal DNA-binding domain containing tryptophan (W) repeats. Mutations in this gene result in Immunodeficiency 65.
