Gene Summary:This gene encodes a member of the nucleotide-sugar transporter family. The encoded<br/>protein is a multi-pass membrane protein. It transports UDP-galactose from the cytosol into<br/>Golgi vesicles, where it serves as a glycosyl donor for the generation of glycans. Mutations in<br/>this gene cause congenital disorder of glycosylation type IIm (CDG2M). Multiple alternatively<br/>spliced transcript variants encoding distinct isoforms have been found for this gene.<br/>[provided by RefSeq, Oct 2014]
