NR2C1 (NM_001032287) Human Tagged ORF Clone Lentiviral Particle

Product data:

Product Type: Lentiviral Particles

Product Name: NR2C1 (NM_001032287) Human Tagged ORF Clone Lentiviral Particle

Symbol: NR2C1 Synonyms: TR2

Mammalian Cell Puromycin

Selection:

Vector: pLenti-C-Myc-DDK-P2A-Puro (PS100092)

Tag: Myc-DDK

ACCN: NM_001032287

ORF Size: 1401 bp

ORF Nucleotide

The ORF insert of this clone is exactly the same as(RC208060).

OTI Disclaimer:

Sequence:

The molecular sequence of this clone aligns with the gene accession number as a point of reference only. However, individual transcript sequences of the same gene can differ through naturally occurring variations (e.g. polymorphisms), each with its own valid existence. This clone is substantially in agreement with the reference, but a complete review of all prevailing

variants is recommended prior to use. More info

OTI Annotation: This clone was engineered to express the complete ORF with an expression tag. Expression

varies depending on the nature of the gene.

RefSeg: NM 001032287.1

RefSeq Size: 1903 bp
RefSeq ORF: 1404 bp
Locus ID: 7181
UniProt ID: P13056
Cytogenetics: 12q22

Protein Families: Druggable Genome, Nuclear Hormone Receptor, Transcription Factors

MW: 51.2 kDa

Gene Summary:

This gene encodes a nuclear hormone receptor characterized by a highly conserved DNA binding domain (DBD), a variable hinge region, and a carboxy-terminal ligand binding domain (LBD) that is typical for all members of the steroid/thyroid hormone receptor superfamily. This protein also belongs to a large family of ligand-inducible transcription factors that regulate gene expression by binding to specific DNA sequences within promoters of target genes. Multiple alternatively spliced transcript variants have been described, but the full-length nature of some of these variants has not been determined. [provided by RefSeq, Jul 2008]
