

Product datasheet for **RC208787L4V**

ERCC1 (NM_202001) Human Tagged ORF Clone Lentiviral Particle

Product data:

| | |
|---------------------------|--|
| Product Type: | Lentiviral Particles |
| Product Name: | ERCC1 (NM_202001) Human Tagged ORF Clone Lentiviral Particle |
| Symbol: | ERCC1 |
| Synonyms: | COFS4; RAD10; UV20 |
| Mammalian Cell Selection: | Puromycin |
| Vector: | pLenti-C-mGFP-P2A-Puro (PS100093) |
| Tag: | mGFP |
| ACCN: | NM_202001 |
| ORF Size: | 969 bp |
| ORF Nucleotide Sequence: | The ORF insert of this clone is exactly the same as(RC208787). |
| OTI Disclaimer: | The molecular sequence of this clone aligns with the gene accession number as a point of reference only. However, individual transcript sequences of the same gene can differ through naturally occurring variations (e.g. polymorphisms), each with its own valid existence. This clone is substantially in agreement with the reference, but a complete review of all prevailing variants is recommended prior to use. More info |
| OTI Annotation: | This clone was engineered to express the complete ORF with an expression tag. Expression varies depending on the nature of the gene. |
| RefSeq: | NM_202001.1 |
| RefSeq Size: | 1291 bp |
| RefSeq ORF: | 972 bp |
| Locus ID: | 2067 |
| UniProt ID: | P07992 |
| Cytogenetics: | 19q13.32 |
| Protein Families: | Druggable Genome |
| Protein Pathways: | Nucleotide excision repair |

MW: 35.6 kDa

Gene Summary: The product of this gene functions in the nucleotide excision repair pathway, and is required for the repair of DNA lesions such as those induced by UV light or formed by electrophilic compounds including cisplatin. The encoded protein forms a heterodimer with the XPF endonuclease (also known as ERCC4), and the heterodimeric endonuclease catalyzes the 5' incision in the process of excising the DNA lesion. The heterodimeric endonuclease is also involved in recombinational DNA repair and in the repair of inter-strand crosslinks. Mutations in this gene result in cerebrooculofacioskeletal syndrome, and polymorphisms that alter expression of this gene may play a role in carcinogenesis. Multiple transcript variants encoding different isoforms have been found for this gene. The last exon of this gene overlaps with the CD3e molecule, epsilon associated protein gene on the opposite strand. [provided by RefSeq, Oct 2009]
