Gene Summary:The protein encoded by this gene belongs to the G protein-coupled receptor family, which
contain 7 transmembrane domains and transduce extracellular signals through
heterotrimeric G proteins. This is an orphan receptor, which displays significant level of
constitutive activity. Association analysis shows preliminary evidence for the involvement of
this gene in susceptibility to bipolar affective disorder and schizophrenia. Alternatively spliced
transcript variants have been found for this gene. [provided by RefSeq, Nov 2011]
