| OTI Disclaimer:              | The molecular sequence of this clone aligns with the gene accession number as a point of reference only. However, individual transcript sequences of the same gene can differ through naturally occurring variations (e.g. polymorphisms), each with its own valid existence. This clone is substantially in agreement with the reference, but a complete review of all prevailing variants is recommended prior to use. <u>More info</u> |
| OTI Annotation:              | This clone was engineered to express the complete ORF with an expression tag. Expression varies depending on the nature of the gene.  |

| Gene Summary: | The modification of proteins with ubiquitin is an important cellular mechanism for targeting<br>abnormal or short-lived proteins for degradation. Ubiquitination involves at least three<br>classes of enzymes: ubiquitin-activating enzymes, or E1s, ubiquitin-conjugating enzymes, or<br>E2s, and ubiquitin-protein ligases, or E3s. This gene encodes a member of the E2 ubiquitin-<br>conjugating enzyme family. The encoded protein shares 100% sequence identity with the<br>mouse and rat counterparts, which indicates that this enzyme is highly conserved in<br>eukaryotes. Multiple alternatively spliced transcript variants encoding the same protein have<br>been found for this gene. [provided by RefSeq, Jun 2013] |
