Sequence:

The molecular sequence of this clone aligns with the gene accession number as a point of reference only. However, individual transcript sequences of the same gene can differ through naturally occurring variations (e.g. polymorphisms), each with its own valid existence. This clone is substantially in agreement with the reference, but a complete review of all prevailing

variants is recommended prior to use. More info

OTI Annotation: This clone was engineered to express the complete ORF with an expression tag. Expression

varies depending on the nature of the gene.

## Proteinase Activated Receptor 4 (F2RL3) (NM\_003950) Human Tagged ORF Clone Lentiviral Particle – RC210404L4V

**Protein Families:** Druggable Genome, GPCR, Transmembrane

**Protein Pathways:** Neuroactive ligand-receptor interaction

MW: 41.13 kDa

Gene Summary: This gene encodes a member of the protease-activated receptor subfamily, part of the G-

protein coupled receptor 1 family of proteins. The encoded receptor is proteolytically

processed to reveal an extracellular N-terminal tethered ligand that binds to and activates the receptor. This receptor plays a role in blood coagulation, inflammation and response to pain.

Hypomethylation at this gene may be associated with lung cancer in human patients.
