

Product datasheet for RC210966L4V

OriGene Technologies, Inc.

9620 Medical Center Drive, Ste 200 Rockville, MD 20850, US Phone: +1-888-267-4436 https://www.origene.com techsupport@origene.com EU: info-de@origene.com CN: techsupport@origene.cn

Semaphorin 7a (SEMA7A) (NM_003612) Human Tagged ORF Clone Lentiviral Particle

Product data:

Product Type: Lentiviral Particles

Product Name: Semaphorin 7a (SEMA7A) (NM_003612) Human Tagged ORF Clone Lentiviral Particle

Symbol: Semaphorin 7a

Synonyms: CD108; CDw108; H-SEMA-K1; H-Sema-L; JMH; SEMAK1; SEMAL

Mammalian Cell

Selection:

Puromycin

Vector:

pLenti-C-mGFP-P2A-Puro (PS100093)

Tag: mGFP

ACCN: NM_003612 **ORF Size:** 1998 bp

ORF Nucleotide

The ORF insert of this clone is exactly the same as(RC210966).

Sequence:

OTI Disclaimer: The molecular sequence of this clone aligns with the gene accession number as a point of

reference only. However, individual transcript sequences of the same gene can differ through naturally occurring variations (e.g. polymorphisms), each with its own valid existence. This clone is substantially in agreement with the reference, but a complete review of all prevailing

variants is recommended prior to use. More info

OTI Annotation: This clone was engineered to express the complete ORF with an expression tag. Expression

varies depending on the nature of the gene.

RefSeg: NM 003612.1

 RefSeq Size:
 3393 bp

 RefSeq ORF:
 2001 bp

 Locus ID:
 8482

 UniProt ID:
 075326

 Cytogenetics:
 15q24.1

Domains: Sema, PSI

Protein Pathways: Axon guidance

Semaphorin 7a (SEMA7A) (NM_003612) Human Tagged ORF Clone Lentiviral Particle – RC210966L4V

MW: 74.8 kDa

Gene Summary: This gene encodes a member of the semaphorin family of proteins. The encoded

preproprotein is proteolytically processed to generate the mature

glycosylphosphatidylinositol (GPI)-anchored membrane glycoprotein. The encoded protein is

found on activated lymphocytes and erythrocytes and may be involved in

immunomodulatory and neuronal processes. The encoded protein carries the John Milton Hagen (JMH) blood group antigens. Mutations in this gene may be associated with reduced bone mineral density (BMD). Alternative splicing results in multiple transcript variants, at least one of which encodes an isoform that is proteolytically processed. [provided by RefSeq, Feb

2016]
