Gene Summary:This gene encodes a cytoskeletal protein that is required for organizing the actin<br/>cytoskeleton. The protein is a component of actin-containing microfilaments, and it is<br/>involved in the control of cell shape, adhesion, and contraction. Polymorphisms in this gene<br/>are associated with a susceptibility to pancreatic cancer type 1, and also with a risk for<br/>myocardial infarction. Alternative splicing results in multiple transcript variants. [provided by<br/>RefSeq, Oct 2009]
