Gene Summary:The protein encoded by this gene, which can bind actin, calmodulin, troponin C, and<br/>tropomyosin, may function in the structural organization of actin filaments. The encoded<br/>protein could play a role in smooth muscle contraction and cell adhesion. Several<br/>pseudogenes of this gene have been identified, and are present on chromosomes 1, 2, 3, 6, 9,<br/>11, 13, 15, 16, 21 and 22. Alternative splicing results in multiple transcript variants encoding<br/>different isoforms. [provided by RefSeq, Jan 2015]
