Gene Summary:The uronate cycle functions as an alternative glucose metabolic pathway, accounting for<br/>about 5% of daily glucose catabolism. The product of this gene catalyzes the dehydrogenation<br/>of L-gulonate into dehydro-L-gulonate in the uronate cycle. The enzyme requires NAD(H) as a<br/>coenzyme, and is inhibited by inorganic phosphate. A similar gene in the rabbit is thought to<br/>serve a structural role in the lens of the eye.
