## RPL36 (NM\_033643) Human Tagged ORF Clone Lentiviral Particle

**Product data:** 

**Product Type:** Lentiviral Particles

Product Name: RPL36 (NM 033643) Human Tagged ORF Clone Lentiviral Particle

Symbol: RPL36 Synonyms: L36

Mammalian Cell Puromycin

Selection:

Vector:

pLenti-C-mGFP-P2A-Puro (PS100093)

Tag: mGFP

**ACCN:** NM\_033643

ORF Size: 315 bp

**ORF Nucleotide** 

The ORF insert of this clone is exactly the same as(RC213376).

OTI Disclaimer:

Sequence:

The molecular sequence of this clone aligns with the gene accession number as a point of reference only. However, individual transcript sequences of the same gene can differ through naturally occurring variations (e.g. polymorphisms), each with its own valid existence. This clone is substantially in agreement with the reference, but a complete review of all prevailing

variants is recommended prior to use. More info

**OTI Annotation:** This clone was engineered to express the complete ORF with an expression tag. Expression

varies depending on the nature of the gene.

**RefSeg:** NM 033643.1

 RefSeq Size:
 453 bp

 RefSeq ORF:
 318 bp

 Locus ID:
 25873

 UniProt ID:
 Q9Y3U8

 Cytogenetics:
 19p13.3

**Domains:** Ribosomal L36e

**Protein Families:** Druggable Genome

## RPL36 (NM\_033643) Human Tagged ORF Clone Lentiviral Particle - RC213376L4V

**Protein Pathways:** Ribosome

**MW:** 12.3 kDa

**Gene Summary:** Ribosomes, the organelles that catalyze protein synthesis, consist of a small 40S subunit and

a large 60S subunit. Together these subunits are composed of 4 RNA species and

approximately 80 structurally distinct proteins. This gene encodes a ribosomal protein that is a component of the 60S subunit. The protein belongs to the L36E family of ribosomal proteins. It is located in the cytoplasm. Transcript variants derived from alternative splicing

exist; they encode the same protein. As is typical for genes encoding ribosomal proteins, there are multiple processed pseudogenes of this gene dispersed through the genome.
