PYHIN1 (NM_152501) Human Tagged ORF Clone Lentiviral Particle

Product data:

Product Type: Lentiviral Particles

Product Name: PYHIN1 (NM_152501) Human Tagged ORF Clone Lentiviral Particle

Symbol: PYHIN1

Synonyms: IFIX

Mammalian Cell None

Selection:

Vector: pLenti-C-mGFP (PS100071)

Tag: mGFP

ACCN: NM_152501 **ORF Size:** 1476 bp

ORF Nucleotide

The ORF insert of this clone is exactly the same as(RC213494).

Sequence:

UniProt ID:

OTI Disclaimer: The molecular sequence of this clone aligns with the gene accession number as a point of

reference only. However, individual transcript sequences of the same gene can differ through naturally occurring variations (e.g. polymorphisms), each with its own valid existence. This clone is substantially in agreement with the reference, but a complete review of all prevailing

variants is recommended prior to use. More info

OTI Annotation: This clone was engineered to express the complete ORF with an expression tag. Expression

varies depending on the nature of the gene.

RefSeg: NM 152501.2

 RefSeq Size:
 1749 bp

 RefSeq ORF:
 1479 bp

 Locus ID:
 149628

Q6K0P9

Cytogenetics: 1q23.1

MW: 54.9 kDa

Gene Summary:

The protein encoded by this gene belongs to the HIN-200 family of interferon-inducible proteins that share a 200-amino acid signature motif at their C-termini. HIN200 proteins are primarily nuclear and are involved in transcriptional regulation of genes important for cell cycle control, differentiation, and apoptosis. Downregulation of this gene is associated with breast cancer. This protein acts as a tumor suppressor by promoting ubiquitination and subsequent degradation of MDM2, which leads to stabilization of p53/TP53. Alternatively spliced transcript variants encoding different isoforms have been described for this gene. [provided by RefSeq, Aug 2011]
